

## Rivers

A winter tree is a river:  
Twigs flow from frozen skies  
join with branches,  
lead to a trunk  
which empties its contents  
into the earth,

as a water-river  
spills into the ocean,  
but only because these seas  
first fill springs  
(which feed the river  
at its sources)  
by way of the frozen sky.
